CHELSEA ATTARD

WHAT do you get when you subtract streamlined classes and textbooks from maths education, and add effective differentiation and a growth mindset?

Jodie Parsons and Yvonne Reilly know the answer, and they shared it with the world during the Institute of Mathematics and its Applications (IMA) International Conference in Glasgow in June.

Parsons, leading teacher – curriculum design and delivery, and Reilly, leading teacher – maths and numeracy at Victoria's Sunshine College, say the school has completely changed its delivery of maths in recent years.

"Now we have no textbook students are no longer streamed, so all who are in that year level are working in the same classroom," Reilly says. "We have teams of teachers working together to create the curriculum, and we have

teams of teachers working in the classrooms to deliver it. It just means we have really effective lessons that are differentiated ... we've got many learning outcomes that address the needs of every student in the class, and we've got really good results because of the way we're doing it now," she adds.

Keen to share their innovative approach with other educators, Parsons and Reilly applied to speak at the IMA conference.

"The conference topic was about barriers and enablers for students to learn mathematics so it was fascinating to see what the struggles that students face when learning mathematics from primary school all the way to university, and what strategies people have used successfully around the world to combat that," Parsons says.

The pair spoke about effective differentiation, finding students' zones of proximal development,

and the importance of developing a growth mindset in students.

"The only thing we emphasise here is progress, so we're all about value adding," Reilly says.

"The students don't necessarily have any control over the level they're at when they arrive at the school, so it doesn't matter to us what level they're at, as long as we can push them forward and that works, because we're accelerating everyone, not just the top 25 students in the year ..."

Parsons says although their approach often seems overwhelming at first, she and Reilly received some great feedback from delegates following the presentation.

"I think it's not until you sit down with people and you talk about all of the steps and the strategies necessary that they realise the enormity of implementing a program like this, however it's absolutely worthwhile for them," Parsons says.

Sunshine College has plenty of attentive teaching, but their work in the weeks since has really taken things up a notch.

"We had access to people at the very highest levels in maths education and maths research in the UK and in Ireland ... so we were able to have some really fantastic high-level conversations about maths education," she says.

"We've got someone from the University of Coventry interested in running a pilot study on the work that we do and she was talking about running a pilot study in Mexico. We would just be thrilled about that if that happened."

Next on the agenda for these passionate maths teachers is a professional development session they will run on November 2, titled *Differentiation: How to create, deliver, assess and survive!* Visit edupk.com/IMA2013 for more details.

TEACHING WITHOUT TEXTBOOKS

A new way of teaching maths

Teachers Yvonne Reilly and Jodie Parsons from Sunshine College have created a new way of teaching maths, without the use of textbooks or homework.

The program is to work at their own pace, but they work, then answers in her how she likes it.

Ms Reilly says the program is not an extremely positive program is voluntary for everybody. It measures for the not complete her.

Sunshine College says that "there's no maths teachers or how we can teach a text book but our program works."

Mr Blunt said "The program is more demanding than I have a great

Results add up for maths with a difference

Benjamin Preiss
Education reporter

Sunshine College maths teacher Yvonne Reilly watches her students arguing about their work, throwing dice and sharing answers in her classroom. But that is just how she likes it.

Ms Reilly has dispensed with textbooks and traditional teaching methods, and the results show students are improving substantially. In her "differentiated" classes, students choose tasks from three levels of difficulty, although they are all learning the same concept.

Ms Reilly teaches about 50 students at a time, with up to two supporting teachers.

The teachers from the classroom, helping students solve problems they might encounter outside school. In a typical lesson, the students roll dice to generate queue times for rides at an amusement park.

Advanced students huddle around a whiteboard once they complete their tasks as Ms Reilly challenges them with more complex ideas.

She has learnt to accept the noise and movement in her classes because she can see the students concentrating and learning.

"For someone who's come from a very structured and normal maths class, that would seem pretty chaotic," she said.

Ms Reilly, who was born in Scot-

Textbook-free Teacher Yvonne Reilly in class. Photo: Justin McManus

land, had completed degrees in biochemistry and pharmacology, and worked as a research scientist in Britain for eight years before coming to Australia in 2004.

The following year, she began teaching maths and science at Sunshine College, where she is now the leading numeracy teacher.

At the time, the school's improvement levels lagged behind

the state average. School principal Tim Blunt was worried about how to turn the results around, when Ms Reilly and a fellow teacher approached him with the new ideas for teaching.

"They said that they'd like to try running a program where teachers got together and designed the work that was going to be delivered to the kids on an individual basis,"

he said. "We got rid of the textbook. None of the students in years 7, 8 and 9 use a textbook."

Mr Blunt said last year's maths results showed students made good progress.

"It was the first time that the NAPLAN results had what was called a relative growth measure, and we found that across the college [at] our three junior campuses

THE AGE ONLINE
On the web
Watch a video of Yvonne Reilly in action in the classroom.

We had about 40 per cent of our year 9 students getting high relative growth, where the state average is about 25 per cent."

He said teachers from more than 30 schools throughout Australia had visited Ms Reilly's classes to learn how they can improve their own maths teaching.

Ms Reilly and fellow teacher Jodie Parsons, who also designed the program, have written books about their classes that have sold around the world and have spoken at international conferences.

Ms Reilly also uses the "scaffolding numeracy" teaching method created by RMIT, in which students are divided into eight levels according to their ability.

State schools are now desperate to attract qualified maths teachers.

Ms Reilly's credentials include a master's degree in leadership and numeracy.

Ms Reilly believes her studies have paid off because they helped her introduce the changes at the school, helping many students reach their potential.

"Our kids are better off here than they are anywhere else and I'm really happy about that," she added.

RECIPROCAL TEACHING IN MATHEMATICS.

Yvonne Reilly, Jodie Parsons and Elizabeth Bortolot.

Sunshine College, Victoria.

An exploration of the use of reciprocal teaching as a tool to improve student literacy and comprehension in mathematics.

Introduction

As stated in the June 2009 Department of Education and Training (DET) report, 'Improving Student Outcomes in Mathematics', the current practice of teaching, learning and using mathematics is better described as mathematical literacy, behaviours and dispositions important for society. As teachers of mathematics, we have observed that many students were under-performing when faced with mathematical problems, i.e. that our students were not mathematically literate.

Although we recognize that the building of mathematical literacy is described by Marzano (2005) as

An Effective Numeracy Program for Middle Years.

Yvonne Reilly, Jodie Parsons and Elizabeth Bortolot, Sunshine College

An holistic approach to improving student numeracy through the implementation of an Mathematics program for all middle years students, incorporating problem solving, improving mathematical literacy, information and communication technology, scaffolding of numeracy concepts in a fully differentiated classroom.

Introduction

Sunshine College is a multi-campus Government secondary school located in the Western Metropolitan Region (WMR) of Melbourne. It was formed in 1991, following the reorganization of six secondary schools into one school of approximately 1000 students. It is positioned across four sites and is made up of three campuses, including a deaf facility and one senior campus. It is a culturally diverse school with many language backgrounds. The population, in general, suffers a high degree of disadvantage and a low socioeconomic position. In excess of 60% of families are in receipt of Educational Maintenance Allowance (according to the school's Annual Report 2009).

In general, the majority of Mathematics classes at Sunshine College are teacher directed with the teacher delivering the lesson from the front of the room. The teacher will then complete a number of examples on the board, which the students copy into their workbooks followed by various exercises from the Mathematics textbook. Classes rarely use concrete manipulatives; students are expected to work individually; assessment is summative; and the opportunity for modification is limited with weaker students expected to complete fewer examples than the more competent students. On each of the junior sites all students receive four fifty-minute periods of Mathematics instruction per week.

In 2008 and after several years of consistently worsening data (AIM & VCE), and the placement of several numeracy coaches from the WMR, Yvonne Reilly and Jodie Parsons began to develop an alternative numeracy program.

The Whole School Numeracy Program

The pedagogy of the revised whole school numeracy program is purposeful. The curriculum is derived from the VELS Mathematics curriculum and each unit of work is based on understanding the Victorian Essential Learning Standards (VELS) levels of our students as determined by On-Demand data.

DELIVERING DIFFERENTIATION IN THE FULLY INCLUSIVE, MIDDLE YEARS' CLASSROOM

Yvonne Reilly and Jodie Parsons

Sunshine College, Victoria.

Despite the universal acceptance that no classroom is a homogenous group of students, the actual task of providing a lesson which accommodates the needs of all students is such a challenge that it is not surprising that many teachers opt to "teach to the middle" in the hope that the majority of students will have their learning needs met. This paper will describe a model of practice which demonstrates how to effectively plan and deliver a fully differentiated and inclusive maths lesson in the middle years' classroom. The philosophy for this model is to empower all learners to choose a task which is "just right" for them.

In the first part of the twentieth century, psychologists and scholars believed that an individual's capacity to learn was a predisposed facet to their intellect and was up which could be neither influenced nor changed. (Binet, 1909; Kohler, 1910). This meant that the learning process was entirely dependent upon the developmental stage of the individual.

By the middle of the century, Piaget's (1952) research into the cognitive development of children and specifically how they assimilate number concepts (1942) agreed with the earlier researchers that what a child is able to learn is determined by the maturity of the child.

In 1978, an alternate view of how cognitive development occurs was proposed by a contemporary of Piaget, Lev Vygotsky. Vygotsky's previous work

Identifying a hierarchy of reflective practices.

Yvonne Reilly and Jodie Parsons, Sunshine College, Victoria.

The analysis of standardised test data such as NAPLAN (National Assessment Program - Literacy and Numeracy), PISA (Programme for International Student Assessment) and TASS (Trends in International Mathematics and Science Study) are often the incentive for education systems and individual schools to initiate changes which are hoped will improve student outcomes. The data along with other standardised measures (On-Demand, Victorian Curriculum and Assessment Authority) are then engaged to track the effectiveness of the change.

At Sunshine College, a multi-campus Government secondary school situated in the Western Metropolitan Region, a community which suffers a high degree of disadvantage. In 2007, a dedicated whole-school literacy program was initiated by the introduction of a junior years mathematics teacher, heralded as the beginning of a significant improvement in student outcomes as determined by NAPLAN, On-Demand and

EFFECTIVE DIFFERENTIATION: WHERE A GROWTH MINDSET MEETS THE ZPD *

Yvonne Reilly and Jodie Parsons

Sunshine College

The challenge of practically providing each student in a class with the opportunity to work at their own Zone of Proximal Development (ZPD) (Vygotsky, 1978), is often insurmountable to many practitioners. Our model not only alleviates the practical aspects of this challenge, but in addition, creates an environment where students believe that they can improve and an environment where students are expected to identify and select the activity which is "just right" for their learning requirements.

Introduction

Sunshine College is a multi-campus Government secondary school located within the South Western Victorian Region. It is positioned across four sites and is made up of three junior campuses, including a deaf facility and one senior campus. It is a culturally diverse school with more than fifty language backgrounds. The population, in general, suffers a high degree of disadvantage and a low socioeconomic position, with an average Student Family Occupation (SFO) index of 0.8, and a school ICSEA value of 909. Our distribution of students compared with the Australian average is shown in Figure 1.

in the then Western Metropolitan Region to a similar level of regional support funding was not, very few schools were able to make use of the funding, being named as one of the least effective schools in the region. A possible reason for this disparity.

It is a challenge to change student outcomes, and to provide a more equitable assessment, is of these data an essential component to help providing a degree of accountability.

Location of the analysis of standardised testing outcomes, although this is undoubtedly an area for analysis and response to Behavioural Outcomes to understand how to improve
