

Home Learning Task 7 – 9 Chance - Likelihood of events

Experimental Probability Task Worksheet

Mathematical language: outcome, equally likely, chance, event, frequency, probability

Task : For this task you will be conducting a series of experiments. Before commencing the experiments you will need to collect the following materials.

Materials needed: Paper cup, matchbox, ruler, bottle top

Your task: For each of the experiments you will need to complete the following steps.

1. Before starting each experiment, record a prediction of the outcome after 30 trials.
2. Perform each task 30 times, observe and record your results.
3. Calculate the probability for each task (paper cups example below)

$$\text{e.g. Pr (cup lands up)} = \frac{\text{frequency of cup up}}{\text{total number of outcomes}} = \frac{\text{frequency of cup up}}{30}$$

Experiment 1 – Paper Cups

Possible outcomes

Complete your prediction and record your observations in a table like this

	Prediction	Observation		
OUTCOME	Frequency	Tally	Frequency	Probability
Landing up				
Landing down				
Landing on side				

Experiment 2 – Matchboxes

Possible outcomes

Complete your prediction and record your observations in a table like this

	Prediction	Observation		
OUTCOME	Frequency	Tally	Frequency	Probability
Landing on its side				
Landing flat				
Landing on its end				

Experiment 3 – Ruler

Possible outcomes

Complete your prediction and record your observations in a table like this

	Prediction	Observation		
OUTCOME	Frequency	Tally	Frequency	Probability
Curved side down				
Curved side up				

Experiment 4 – Bottle top

Possible outcomes

Complete your prediction and record your observations in a table like this

	Prediction	Observation	
Right way up	Frequency	Tally	Frequency
Upside down			

Reflection

- 1) Based on your 30 trials, which events (experiments) had equally likely outcomes?
- 2) How did your predictions for each experiment compare with the trials?
