Introduction:

Making money in the public industry has never been harder, as many of these facilities around us start to close down as they cannot remain standing. Businesses are suffering to make a profit. People are starting to wonder whether these public facilities are earning money.

This investigation focuses particularly on the costs of maintaining a commercial pool and if the public admissions will cover the costs. It will conclude on whether our public facilities are set up to make a profit or if they are doomed to lose money.

Why I chose this topic.

I chose this topic because of the increasing handover of organisations and authority of, namely swimming pools. This affects the community, as swimming pool handovers have happened locally to my suburb. Handovers of this large scale usually are caused from small revenue, to investments that have been paid off, resulting in debt.

In this investigation, I put myself in the situation where I have loaned a large amount of money in order to try to build a profitable business. The results of handing over a swimming pool can be catastrophic, like increased fees and once introduced, the community is to suffer. So this investigation will uncover how to make sure your swimming pool does not become a burden and debt.

Aim: My aim will be to uncover how public facilities, namely the swimming pool may be not profiting in terms of how they operate and the fees and expenses that are usually paid by the general public are not enough to support the business.

To do this, I will generate a theoretical swimming pool with all concepts included and thought of to determine whether public swimming pools are really worth their expense.

Hypotheses -

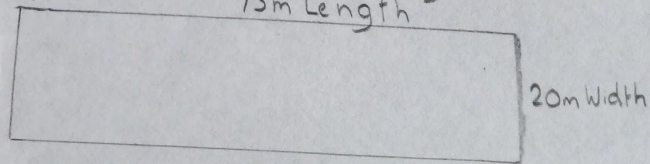

- Hypothesis 1: I believe that swimming pools spend over 4 million upon their emergence and take over \$200,000 a year to maintain.
- Hypothesis 2: I estimate that the swimming pool takes an estimated 5 years to generate revenue and come out of debt.

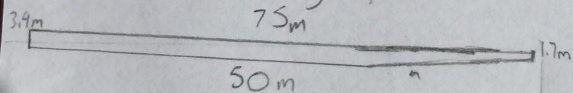

HYPOTHESIS

The pool:

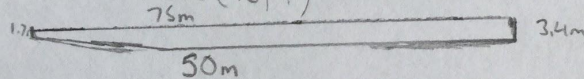

Top view or birds eye view:

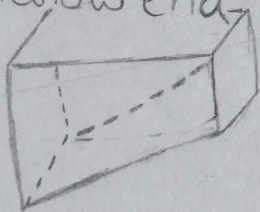

side view (right)

shallow end

deep end

Pool Measurements with bird eye view and side views, provided with measurements to help the viewer better understand the next several slides, as they calculate how much it costs to dig the area of the pool.

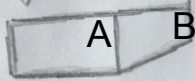

Pool Measurements

Total capacity 4,675 KL, volume 467,500,000m cubed.

Part 1: Volume of the pool

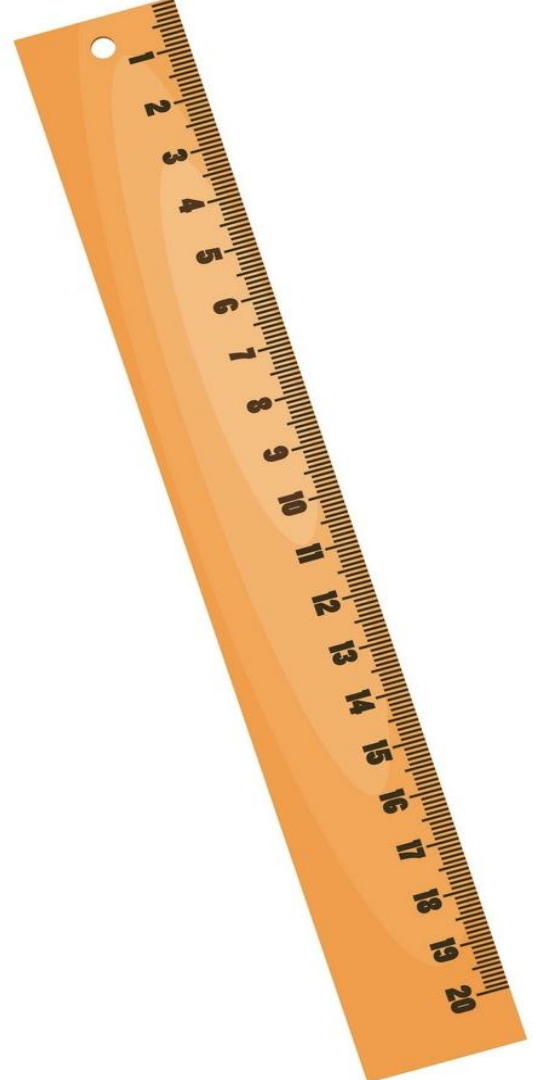

Theoretical, $50 \times 3.4 \times 20$ $50 \times 3.4 \times 20$ $7 \times 20 + 25 \times (1.7 + 3.4) / 2 \times 20$
 so it looks like $L \times D \times W$ $L \times D \times W$ $L \times D \times W$ Trapezoid

This page (above) is for calculations of the volume of the pool which is necessary for the worked problem: (across) because it gives the necessary water needed in the next slide..

the volume is based on the equation above, so

$$\begin{aligned}
 m &= 50 \times 3.4 \times 20 + 25 \times 5.1 / 2 \times 10 \times 20 \\
 &= 50 \times 68 + 25 \times 51 \\
 &= 50 \times 68 + 25 \times 51 \\
 &= 25 \times 187 \\
 &= 4675 m^3, \text{ and based on the rule } 1 m^3 = 1 ml, 4675000000 cm^3 \\
 &\quad \downarrow \\
 &\quad = 4675 m^3 \\
 x &= 4675000000 cm^3 = x ml \\
 x &= 4675000 L, \text{ which} = \underline{4675 KL}
 \end{aligned}$$

Digging the pool.
 Every pool needs to have been dug: whether it's natural or manmade. This time, to create a hypothetical pool I took the area and calculations of the pool to find how much it would cost to dig it out and how long. Using some estimates of quotes (6), it cost me a total of \$172,300 in 352 days to have completed the digging of the pool.

The side on view of the pool is trapezoidal.

So lets say the dimensions of the theoretical/hypothetical pool is as mentioned above, $(50 \times 3.4 \times 20)$ + an irregular.

How long and how much would it cost if the following rules are placed in the digging industry?

- For every hour of work is \$60/builder
- Maximum work hours 5rs a day
- Payment increases by \$15 per each hour on the last
- Diggers dig $1.5 \text{ m}^3/\text{hour}$
- \$300 to hire 1 builder.

1. Calculating how many worker hours are needed with equation $(50 \times 3.4 \times 20 =$
 $= 50 \times 68$
 $= 3400 = 3400 \text{ m}^3 + 25 \times 1.7 \times 20$
 $= 34 \times 25$
 $= 850 \times 5$
 $= 4250 \text{ m}^3 \text{ total to be dug}$
 $\div 1.5 = 2834 \text{ digger hours}$

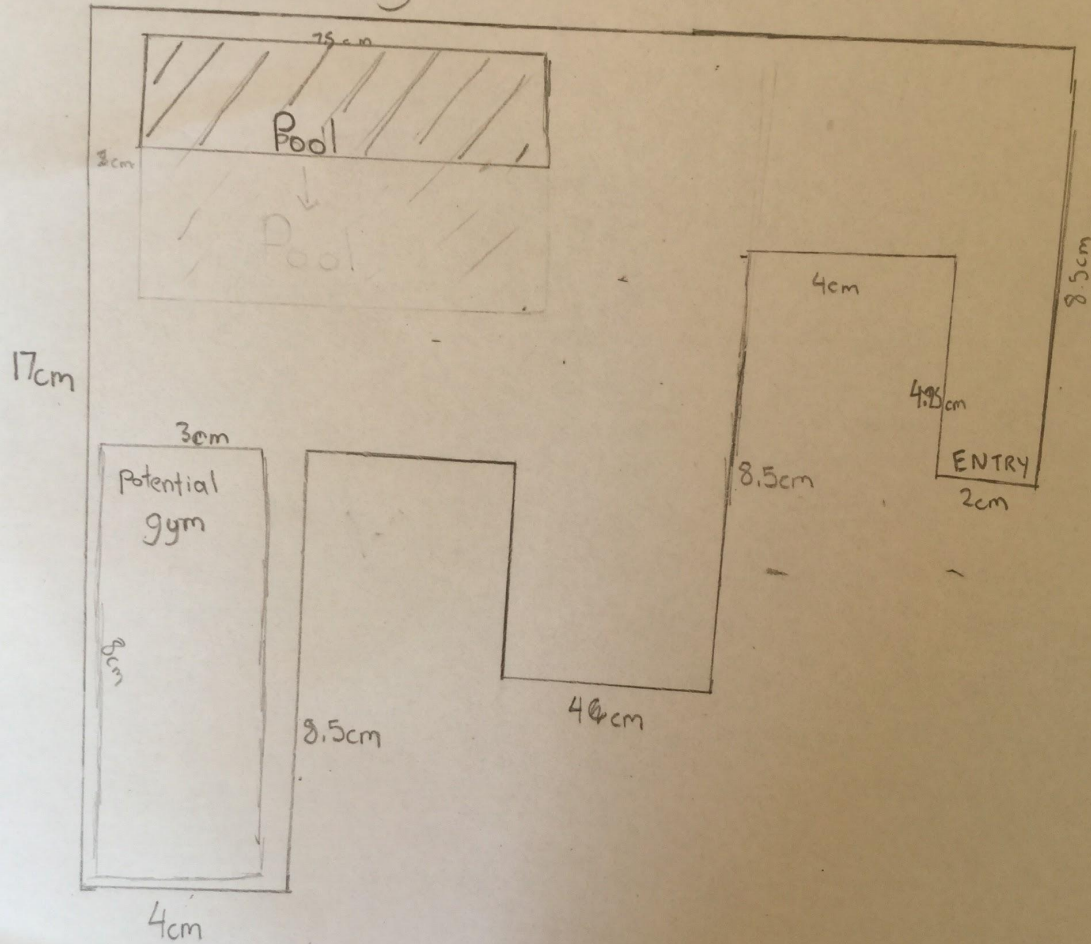

2. Testing digging options
 $2834 \text{ covered by 1 digger}$
 $= \$300 \text{ flat fee} + 2834 \times 5 =$
 $= \$300 + 14170$
 $= \$14,470 \text{ for 1 digger}$
 total cost: $(2834 : 365) \text{ years}$
 approx 8y
 @ interest of 1%
 of 4 million of by
 8yrs simple interest
 $= \$320,000 \text{ interest}$

2. fastest dig: 1 day
 $2834 \times 300 + 2834 \times 60 = 2834 \times 360$
 $= 283400$
 $= 943200 \text{ est}$

However, 2834 is near
 we do not dissable by
 wish to have 1yr plus
 because simple interest,
 so $2834 : 365 = \text{aprox } 8.50$
 $8 \times 300 + 8 \times 60 \times (2834 : 8)$
 $= 2400 + 480 \times 354$
 $= 2400 + 169,920$
 total cost = 172,300 @ 352 days

Tiling the outside of the pool

All swimming pools that I have been to have tiling and after I finished the digging process, I can start to tile the outside areas.

The total cost of tiling the outside of the pool will be: \$687,140

Once we have dug the base of the pool, it needs to be tiled. Part 1, tiling the outside.

So, if this is the pool shape, determined by me, to tile the outside with national tiles \$39.95 tiles. What would be the cost to tile the swimming pool's outside.

Formula used: area of whole - pool area.

whole = $170 \times 40 = 6800$
 $85 \times 40 = 3400$
 $85 \times 20 = 1700$
 $25 \times 20 = 500$
 $6800 - 3400 - 1700 - 500 = 1200$ (pool)

Part A, $170 \times 40 = 6800$

$$\begin{aligned} &= 6800 \\ &+ 85 \times 40 \\ &= 3400 \end{aligned}$$

5100, (because pattern in shape area)

$$\begin{aligned} &+ 1700 \\ &+ 1700 = 6800 \\ &+ 5100 = 11900 \\ &+ 6800 = 18700 \end{aligned}$$

18700 m²

$$18700 - (75 \times 20)$$

$$= 18700 - 1500$$

$$= 17200 \text{ m}^2 \text{ of area needing tiles}$$

So, 39.95 is about \$40

$$\text{so } 17200 \times 40 =$$

$$= \$688000 - (17200 \times 0.25)$$

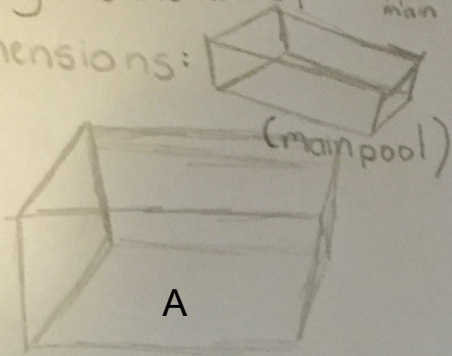

$$= \$686000 - 860$$

$$= \$687140$$

in tiling outside

Tiling insides of the pool

tiling the insides of the pool
dimensions:

$$20 \times 50 \times 3.14, \text{ so } 50 \times 3.14 =$$

$$= 2(50 \times 3.14) + 20 \times 50 + 2(20 \times 3.14)$$

$$= 340 + 1000 + 136$$

$$= 1476 \text{ total sqm of surface area.}$$

$$\text{if } 39.95/\text{sqm, then } 1476 \times 40 = 59040 \text{ ops}$$

$$= 59040 - 73.8$$

$$= \$58966.20$$

to tile the insides
of the main pool.

Most pools are
tiled, as a safety
precaution, so
I calculated that
it costs

\$58,966.20 to
tile the surface
are (insides) of
the main pool.

Hiring Lifeguard- per annum

Each lifeguard booked is a \$215 flat fee for up to 3 hours. Each additional half hour is \$36/half hour (\$72 per hour) billed to the nearest half hour each lifeguard. Therefore if the swimming pool needs 4 lifeguards working on a 8 hour shift, with 3 present at any given moment how much would I pay? $24 \text{ lifeguard hours} \div 4 = 6 \text{ hours pp}$
 $\$215 + 72 \times 3 = \$216 + 215 = \$431 \times 4 = \$1724 \times 365 \text{ days} = \$629,260$, and **given a 20% discount (from a deal given by the lifeguarding agency at footnote(5) in the bibliography) = \$503,408**

 $m = Kg$
 $\% 100m = kg$
 $3.5kg$
 680
 1730
 $30 = 1050 + surface$
 top area:

Covers or no covers

evaporation: I calculated whether having covers would be cheaper (micron cover) and resized a 15 square metre area of covers to the needed area for the pool to prevent a high evaporation rate.

So I decided to build an external structure of metal iron which didn't cost much, so I calculated the surface area and labour costs and it cost \$3,200 which is the cheapest option.

Seating Areas

Podium 1-2 hours on average, and operates 8hr/day
∴ if 119 900 visits, $\frac{1}{2}$ come for 1hr, half go for 2hr
then $119\,900 \div 365 = 328.5$ therefore that many visits so 113
 $= 341 \div 8 = 42.6$ seats needed $\$5 = \4120 for stadium seating $+ 220$

Construction Labour minimum wage \$20/h
and 1730 surface area outside, width of 8m = 2595m
builders construct 4m 1.75m/h, hiring cost of \$100 per 1 builder
 $2595 \div 1.75 = 1482$, ∴ 1482 worker hours, and builders work for 5
a day, is = $\frac{1482}{5} = 296.4$ worker/day ~~20d~~ 10d for 20w = 2000
finish in 20 days $+ = 1000$
∴ \$3000 to construct the outside $50 \times 20 =$
 $+ 300 \text{ tax} = \$3300$

Seating areas and as mentioned finding how many people go there:

I used the common knowledge that people spend 1 - 2 hours there so I divided visits: 119,000 by 365 (days) and then found that if $\frac{1}{2}$ people go there for 1 hour, and the other $\frac{1}{2}$ go for 2 hours, you get 341 hours divide by 8 and **that's approximately how many chairs you need. Totalling \$3,300 (43 chairs) with tax.**

Finding suitable land: with a high population. I had a look at the prices in these growing suburbs and you should know that the more people that are in that suburb the more entrance there will be four people who want to go swimming. However after I compare and found that the highest ones were Southbank and Richmond I could not find any land there on Realestate.com, and resorted to finding a 12 million dollar 4,500 sqm land in Kew, which I needed to downsize. The next slide is me working out the population growth in the suburbs with a high growth rate or population.

Get in touch

Finding Land - looking for, $\frac{680}{100} = 13600$ $19000 m^2$
- Populations of suburbs: let's look at ones with high population
Richmond 32,848 - 27% $\times 10$ years $\rightarrow 40,000$
St Kilda 28,141 28% = 36500
Brunswick 27,123 25% = 34000

Biggest % increase

South Bank $20,470 \times 100\% = 40960$

Land in South Bank, $19000 m^2$
- $328 m^2$ only

Calculating a suburb with a high growing and high population based on a table in the last slide.

However there was no land in Southbank or Richmond, who have high population which means higher revenues, so I went on real estate and found a big enough land in Kew, and found their population a few slides later.

Part I

Mathematics - downsizing the land - 14 million at new

$$14m = 5297 \text{ sqm}$$

we need (1900 sqm) of land

$$5297$$

$$\div 1900 \approx 2.787 \text{ is}$$

$$2 \frac{3800}{1900} \approx 2.787$$

how much % of 100 is
1900 of 5297

4,740,000 for land

+ tax = 10%

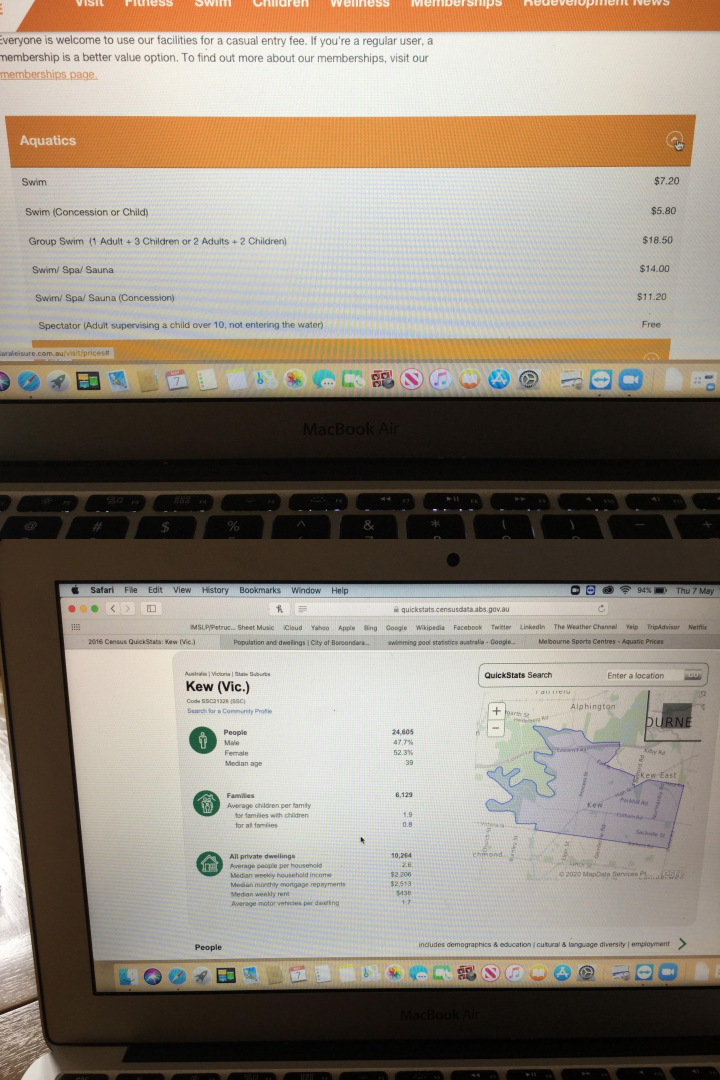

$$\begin{array}{r} 4740 \\ 474 \end{array}$$

$$\$5214000$$

total: \$5,214,000

$$\begin{array}{r} 30\% \quad 34\% \approx 34\% \text{ of} \\ 14000000 = \\ 1.4 \\ 1.4 \\ 1.4 \\ 0.7 \\ 0.54 \\ = 4.74 \text{ million} \end{array}$$

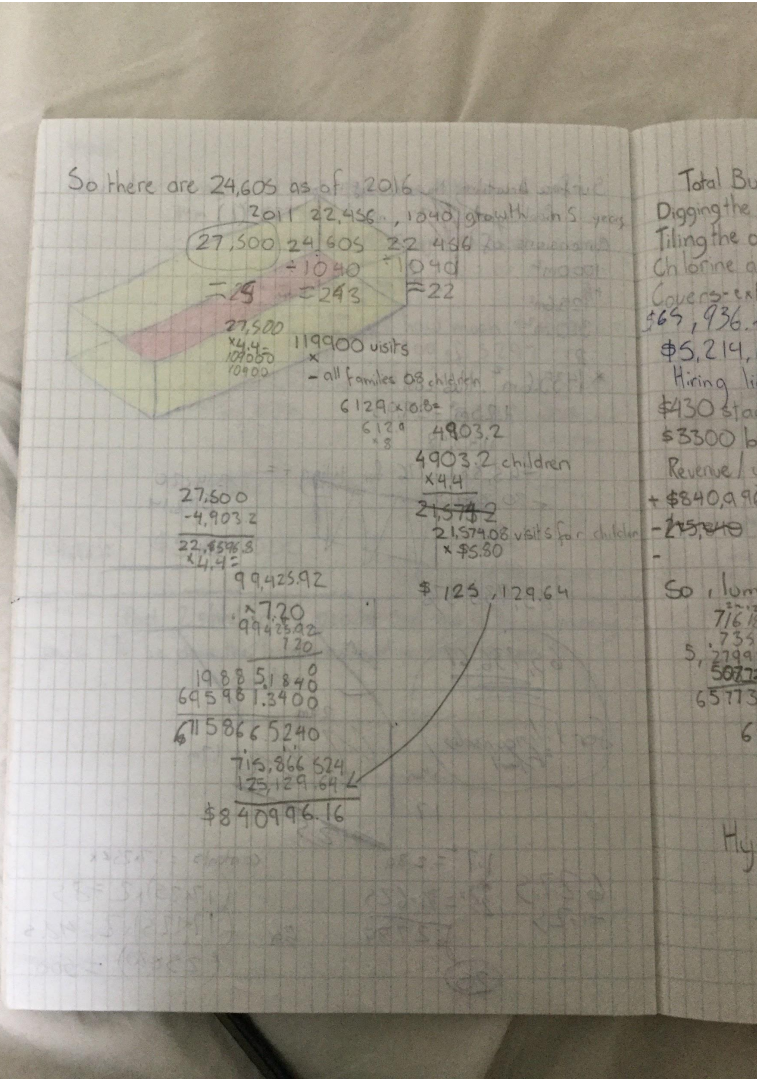

Resizing big land into preferred size: So, as from a few slides ago, I found parkland costing \$14,000,000 and needed to resize it from is 5,297 sqm to the needed 1,900 sqm, so that several millions could be saved. It cost \$5.124 million dollars with 10% of tax being only 34% of the \$14 million.

Population in Kew, used to determine how many people that go to the swimming pool every year to find the yearly revenue: I used the known rates that 4.4 times people go to the swimming pool over $\frac{1}{2}$ year on average and found the cost from a local Kew website and found how many kids and adults as they were entirely different prices. I found that the swimming pool would hypothetically earn \$840,996.16 at the $\frac{1}{2}$ of the financial year. (without side costs implemented yet)

Working out revenue

Based on report saying people tend to go to the swimming pool 4.4 times per half year, I calculated that within the kids population of Kew, there would be the number of children times 4.4, then at 21,574.08 visits for children at \$5.80 dollars, I did separate the age groups as prices from Kew swimming pool differed entirely, and for adults, the number of adults x 4.4 visits = 22,596.8 times \$7.20 dollars. Which gives me a total of \$840,996.16 x 2, as there are two semesters, so I got \$1,681,992.32 per annum.

Final Financial Calculation and results- Part 1.

All costs included, I totalled \$6,658,768.60 as the expenditure for to establish the pool. So, theoretically my \$4 million estimate to launch the pool is not accurate, because it takes \$6.658768.60 to establish a swimming pool - there's not much that can be done to reduce the cost to \$4 million given that the land itself already costs \$5 million.

Final financial results

- Expenditure during establishment (in dollars)
 - + 172,300, taking 352 days the digging process
 - + 687,140, tiling the outsides of the pool
 - + 58,966.20 to tile the insides of the pool
 - + 5,124,000 land in Kew, 1900 sqm
 - + 503,408 (lifeguards)
 - + 41,526 (Chlorine + Water) for liquids
 - + 3200 for external metal structure.
 - + 3300 seating seats
 - + ? Simple interest to be determined by 1% of the spending above.

$$\begin{aligned} &= +859,440 \\ &+ 5,182,966.20 \\ &+ 544,934 \\ &+ 5,500 \\ &+ ? \\ &= +1,404,374 \\ &+ 5,188,466.20 \\ &= 6,528,402.20 \\ &= 6,592,840.20 \\ &+ \frac{1}{100} \times ? = 6,592,840.20 \\ &= 6,658,768.60 \\ &\underline{\$6,658,768.60} \\ &\text{for establishment} \end{aligned}$$

part 2. revenue

is at \$1,681,992.32,

so if lifeguards cost,

503,408 per year,

and chlorine + water =

41,526, then,

$$1681992.32 - 544934 = \frac{1681992.32 - 544934}{11370}$$

$$= \$1,137,058.32$$

= 6 years to

interest is ad

Hypothesis 1: 4 million on establishment

⊗ @ 6 million

Hypothesis 2: 5 years to generate revenue

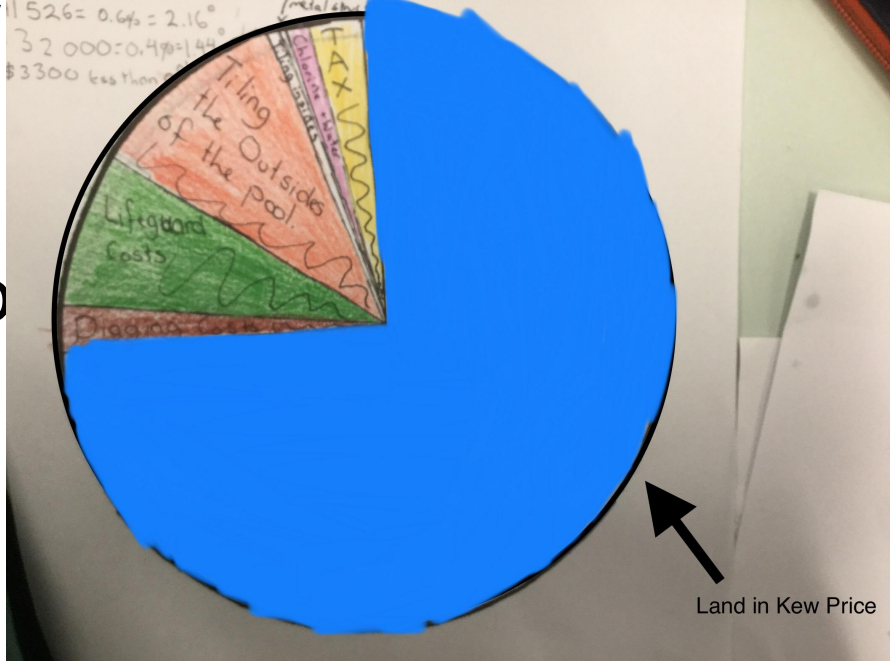

⊗ near close @ 6 years.

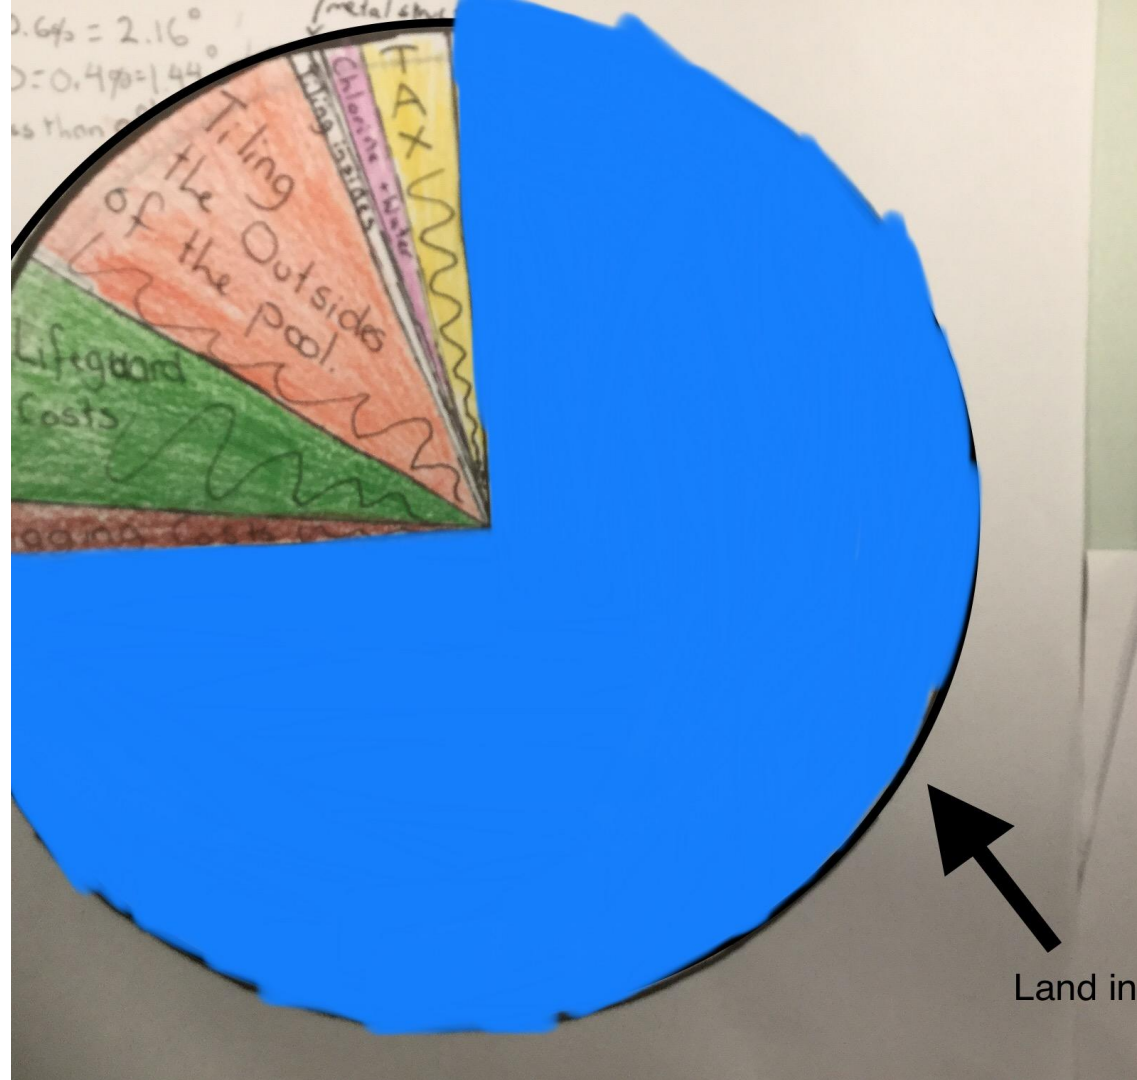

Simple Interest Formula

Simple interest is the total investment, as seen on the final financial results slide as symbol x is determined by the report of the expenditure based on past slides and is 1% of the lump sum that will be the loan which the simple interest is derived from. I calculated it would be costing \$65,928.4 for simple interest as it is $1/100$ of the final financial report.

I created a graph to show how much the expenditure of establishing a swimming pool costs in a non-biased graph to better help the viewer understand how I plan to spend the money and how much percent it really is, (e.g, land costs around 75%, so if we had preowned land, then we could save 75% of the total cost.)

A pie graph of the expenditure of total costs is provided. The largest section is the price of land, whilst seating is less than 0.01% of the total cost.

Graph of total cost

TOTAL: \$665,768.60 for establishment

+\$172,300 = 25.8% = 92.7°

+\$687,140 = 10.3% = 36.9°

+\$58,966.20 = 8.8% = 31.5°

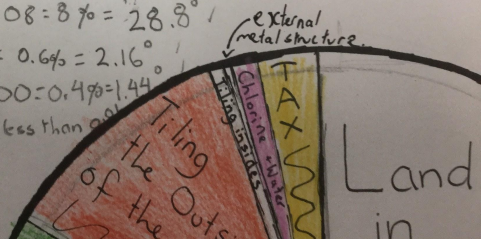

+\$5,124,000 = 769.2% = 2768.4°

+\$503,408 = 75.6% = 271.8°

+\$41,526 = 6.2% = 22.3°

+\$32,000 = 4.8% = 17.2°

+\$3,300 less than 1% = 0.5°

Bar graph of Expense to establish a pool.

I tried to make this information as not skewed as much as possible, but mistakes occasionally happen.

Bar graph interpretation

My interpretation of the bar graph is that land in Kew costs an expensive five million, one hundred twenty four thousand dollars, the highest bar/ sector in the graph.

The lowest cost is the external metal structure, hardly visible to see on the graph, situated at \$3,200, just one hundred dollars less than \$3300, the price of the seats.

An observation I made was that if all the other costs were added up, they were around the ratio of 1 cost (excluding land price) : 3 costs (only price of land)

Final Financial Calculation and results- Part 2.

My second hypothesis was near correct after I calculated revenue and found how many years to pay back the debt was around 6 years had simple interest occurred. My hypothesis, being five years is although close, incorrect. Now, I want to see if I can anyhow correct hypothesis 2, being that we can not save money on Hypothesis 1, so we must do what we can when we can. My first investment will be the gym, usually situated in swimming pools, and although it will not hypothetically attract more customers, it will be another investment, that hopefully will boost hypothesis 2.

st to be determined by 1% of the spending above.

part 2. revenue
is at \$1,681,992.32,

so if lifeguards cost,

503408 per year,
and chlorine water =
41,526, then,

$$1681992.32 - 544934 = \frac{1681992.32}{544934} \\ 1137057.68$$

$$= \$1,137,057.68$$

= 6 years to pay off if

interest is added.

Hypothesis 1: 4 million on establishment

☒ @ 6 million

Hypothesis 2: 5 years to generate revenue

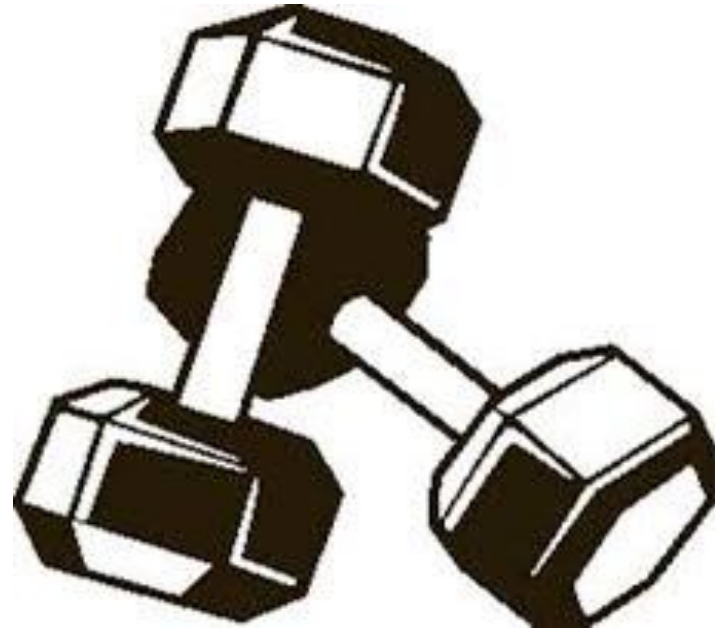

☒ near close @ 6 years.

Investment No.1: calculating costs of a gym

Part 1: Equipment and area.

The equipment at the gym costs between \$200 and \$5,000 per strength rack, see (7), so if I decide to give the gym a maximum budget of \$40,000 then there would need to be 5 fitness machines, and 10 racks to facilitate around 20 people at once.

So, for that I will take the median value of each of these strength rack costs and use that as a fair estimate of a price to pay for each one. To use the strength racks as an example, the median of \$200 and \$5,000 is \$2,600. To have 10 strength racks, I then multiply that value by 10 which is \$26,000. This is quite excessive! Now, on the next slide, I will calculate the median prices for the machines.

Investment No.1: calculating costs of a gym

Part 1:Continued.

In this slide, I will calculate the average prices for the other machine in order to determine the cost of the 5 fitness machines which will be used to find a total cost for gym equipment.

The final cost of all the equipment needed for the gym is 26,000 dollars in strength racks plus 8,250 dollars in machines, so \$34,250 would be spent in the gym to accommodate about 20 people at a time.

- Elliptical machine: \$1,000-\$3,000
 - Stairmaster: \$2,000-\$4,000
 - Free weights: \$500-\$2,000
 - Bench press \$200-\$500
- Median: \$2000
Median: \$3000
Median: \$1250
Median: \$350
- Average
\$1,650

Finally, we need to multiply 1,650 by 5 in order to purchase 5 machines - which is \$8,250.

Part 2: Pricing on entry and entrants

At the Kew recreation centre, where I get my pricing insights, it costs \$25.70 for gym access for non concession adults. About 18% of actually go to the gym, so if they go 1 times a year, see footnote 9, then considering the aim to get Hypothesis 2 correct, we could fit in 1 time for 18/100 of the people.

So, Kew, as mentioned has a population of 22,596 adults, and if 18% go the gym 24 times a year, how much would I earn in a year = $22,596 \times 0.18 = 4067$, $\times 25.70$ equals \$104,753.2 dollars per annum, and to our happiness, the equipment only needs to be replaced once in some 10 years.

KEW RECREATION CENTRE

Everyone is welcome to use our facilities for a casual entry fee. If you're a regular user, a membership is a better value option. To find out more about our memberships, visit our [memberships page](#).

Part 3: Is running a gym a profitable investment?

Yes, the total earnings were in the equation $\$104753.2 - 34250 = x$, and x is the profit from a year of a gym equaling $\$70503.2$, so now we put this in the total budget and find that the equipment does not need to be replaced and that you earn $\$104753.2$ per year after the first. So if it was to be five years of a gym, it would cost $\$70503.2$ plus $4(104753.2)$ equals $489516.$, so applied to the five years of maintaining a gym, obtained from the financial results section is 1137057 dollars, so $x \times 5$ is $\$5,685,285$ dollars plus $\$489516$ is **$\$6174801$ dollars. Which is just around 500 thousand off our hypothesis 2. Let's do investment 2!!!**

Discussion

Managing a swimming pool since its establishment and first year costs about \$6.5 million given the investor/ builder starts on scratch (needing to buy land and furniture).

I found the generated revenue per annum, I calculated that it would take over 6 years to generate actual revenue, which is highly dependent how populated the area is.

Discussion: Part 2

Reflecting back on this investigation, without a lump sum of money, a privately established swimming pool for the public is not actually worth it, given you could spend some 6 years spending your money on a more profitable investment.

Final financial results

1. Expenditure during establishment (in dollars)
- + 172,300, taking 352 days the digging process
 - + 687,140, tiling the outsides of the pool
 - + 58,966.20 to tile the insides of the pool
 - + \$5,124,000 land in Kew, 1900 sqm
 - + 503,408 (lifeguards)
 - + 41,526 (Chlorine + Water) for liquids
 - + 3200 for external metal structure.
 - + 3300 seating seats
 - + ? Simple interest to be determined by 1% of the spending above.

$$\begin{aligned} &= +859,440 \\ &+ 5,182,966.20 \\ &+ 544,934 \\ &+ 5,500 \\ &= +11,404,374 \\ &+ 5,188,466.20 \\ &= 6,652,840.20 \\ &= 6,592,840.20 \\ &+ 100\% = 6,592,840.20 \\ &= 6,658,768.60 \\ &\underline{\$6,658,768.60} \\ &\text{for establishment} \end{aligned}$$

part 2. revenue

is at \$1,681,992.32,

so if lifeguards cost,

503,408 per year,
and chlorine + water =
41,526, then,

$$1681992.32 - 544934 = \frac{1681992.32 - 544934}{11370}$$

$$= \$1,137,058.32$$

$$= 6 \text{ years to}$$

interest is at

Hypothesis 1: 4 million on establishment

☒ @ 6 million

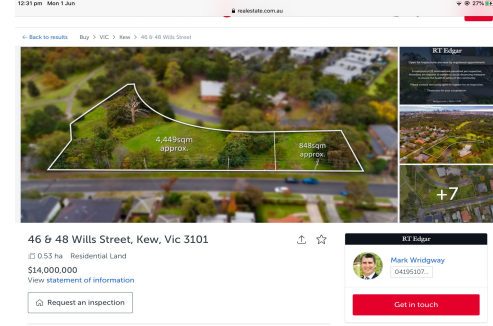

Hypothesis 2: 5 years to generate revenue

☒ near close @ 6 years.

Conclusion

I learnt that establishing a swimming pool takes over \$6.5 million , and this value is only closely estimated, and to generate revenue in a suburb with an available land space big enough to suit the necessary 1900 sqm is not worth time and money.

It takes over 6 years to generate revenue, if you were given an sum of money with simple interest (like this investigation) unless you are specifically trying to lesuirise your area, e.g. being the council, or a leisure group.

Conclusion: Continued

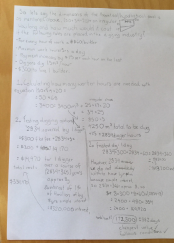

My hypotheses, namely hypothesis 2 was proven near correct, whilst hypothesis 1 was not, and my aim was achieved as I have uncovered whether swimming pools are profitable.

Analysis

An example of analysis would be the digging of the pool- I tested out whether one person, given the high fees of \$300 per builder compared to \$60/h, would be cheaper than the other options, and surely it was, but a high interest rate stopped it (based on a large investment). Next, I tried to minimise the time by hiring too many diggers, and that took too much, so thinking mathematically, I hired enough builders not to compile interest by going over the one year mark and managed to save a fortune.

Using this thinking, is the only way to find the true costs and profit of swimming pools.

Reflection

In this investigation, I found that many considerations are based on pricing and time, and without fully thinking about the final result can mean thousands and in rare cases, ten of thousands of dollars lost due to not thinking mathematically.

I highly do not recommend building a public swimming pool from scratch, but leaving it to those who are entrusted to keep our area leisurely.

List of mathematical concepts included

- Area and Perimeter - used to calculate the surface area of the pool sides and outside of the pool area. Perimeter was used to calculate the pricing of an external metal structure. (Slides 15, 10 and 7 in particular)
- Volume and Capacity - used to determine how much water and space the pool has. (Especially Slide 8)
- Resizing and rationing - used to find the closest estimation of the price of the land and drawing a scaled and rationed birds eye view of the facility. (Slide 19)
- Time and work (Speeds) - used when determining how long digging the pool and building a structure took. (Slide 9 in particular)

List of mathematical concepts included: Continued

- Using percentages - used to find population growth rates and percentage of land I would use for the pool. (Slide 18 in particular)
- Money and costs - used to determine the pricing of many features and the total price of the swimming pool. (Slides 21,22, 28 in particular, although used in nearly all slides)
- Fractions - used to find simple interest. (Slide 22)
- Graphing and Drawing: used for birds eye view, and other views, (slide 7, a little in 8, 10, some in 12 and slide 15.)
